

## InGenius Application Server for SpectraLink Handsets

Increase company communication, productivity and workforce mobility with InGenius Application Server for SpectraLink 8020/8030 Wireless Telephones. Includes Set-to-Set Text Messaging and Corporate Directory Lookup.

### Set-to-Set Texting

Operating like an instant messaging client on your SpectraLink set, you can see which contacts are available, set your presence, send instant text messages, and see chat history. It is a very simple yet powerful texting tool that operates similarly to cell phones.

The text messaging application is ideally suited for SpectraLink phone users that work in environments that are not conducive to talking across the sets.

And for managers, the set-to-set texting application allows you to deploy time sensitive information quickly and efficiently to specific team members.

Texting Contacts and Availability

#### Features

- Real time set-to-set texting
- Texting icons indicate a contact is associated with a SpectraLink set and can be texted
- Presence automatically associated with each contact to indicate their availability (Busy, Here, Away)
- Users can set their presence to busy to avoid interruptions
- Conversational threads displayed to show full conversation between contacts
- Conversation time stamping to indicate when a conversation took place
- Message storing for all text messaging for users to review conversation history
- Store and forward messaging ensures delivery of texts even if contact is away or set to busy

Real time Set-to-Set Texting

## Corporate Directory Lookup

Directory lookup gives you quick and easy access to all the contacts listed in your LDAP directory. Whether you are looking for the number of the manager on the production floor, or the product manager at corporate headquarters, all your important contacts are right at your finger tips.

Directory lookup also gives you the ability to personalize your phone book by enabling you to pin numbers. Pinning numbers is similar to creating a favorites list. This is an ideal time-saving feature for people that make frequent calls to the same group of individuals.

Pinning Contacts  
to Generate a Favorites List

### Features

- Search is tied into corporate directory for easy access to all contacts.
- Don't have a corporate LDAP directory? Just create your own directory using an XML file.
- Real-time search displays contacts after only a few characters are entered into the search field.
- Pin contacts once a search has been performed to generate a favorites list.
- Call a contact by pressing the green Send button when a contact is found.
- Supports multiple phone #'s per LDAP contact.
- Text icons appear when performing a search to indicate contact can be reached by text.

Corporate Directory Search

## Custom Applications

These applications are created using a powerful custom framework that allows applications to be built using commonly available Microsoft .Net development tools. The Application Framework runs on a standard Windows Server.

The framework supports: a login/logout system for users who share phones, applications that continue to run in the background, multiple fonts, graphics capabilities, apps that can cause the phone to ring and can pop up alerts as required.

Possible applications include: Nurse call stations, "code" broadcasts with Accept/Deny, patient vital statistics monitor, broadcast alert messages to all phones, room service and housekeeping alerts and custom apps for use in other vertical markets.
